# HIOKI

Packed with Features to Ensure Accuracy in Battery Measurements

○ Circuit design friendly for impedance measurements that minimize errors between channels (Effect: 0.01% f.s.*)

○ For OCV measurement, internal resistance measurement, and external potential measurement of battery cells

○ Measure battery modules up to 60 V DC

○ Switch between voltmeter and battery tester while testing

○ Built-in short-circuit protection fuse for each channel

CE
3 year Guarantee

* For BT4560 100 mΩ range, R measurements, and a measurement frequency of 1 kHz

Multi-channel Battery Testing

Combine the SW1001 or SW1002 with a battery testing instrument to measure a battery cell's OCV (open circuit voltage), internal resistance, reaction resistance at low frequency, Cole-Cole plot, and external potential on multiple channels.

＊ One 2-wire module and one 4-wire module or 4-terminal pair (BNC) module can be used together (see page 7).
Only one channel can be measured at a time. Two modules cannot be used at the same time to measure multiple channels.

Battery Measurement Supported by Exclusive PC Application

Use the free, downloadable PC application to perform various measurements easily.

OCV Measurement function

	CH	V [V]	V 1st data [V]	dV [mV]	dV [mV/day]	dV/Last 1hr [mV/hr]
▶	1	+03.782915E+00	3.782930	−0.015	−28.799	−1.201
	2	+03.782915E+00	3.782932	−0.017	−32.638	−1.361

Enjoy basic functions as well as a newly added dedicated OCV measurement function.
This allows you to measure initial voltage, voltage drops, voltage drop rate (mV/day), and the latest voltage drop rate (mV/hour) in addition to OCV measurement values.
A judgment function is also included, making it easy to determine which battery cell is experiencing aging defects.

Logging function

Use in combination with supported measurement instruments to perform logging measurements (Interval setting: 1 second to 60 minutes) for up to 264 channels. The judgment function makes it easy to determine the channel on which an abnormality occurred.

Multi-channel Cole-Cole plot measurements
Use in combination with the BT4560 or the IM3590 to perform multi-channel Cole-Cole plot measurements.
Allows testing to be performed efficiently for R&D and quality assurance.

Supported measuring instruments: PRECISION DC VOLTMETER DM7275, DM7276
BATTERY TESTER BT3562, BT3563, 3561
BATTERY IMPEDANCE METER BT4560
CHEMICAL IMPEDANCE ANALYZER IM3590
RESISTANCE METER RM3545

・Save measurement data in CSV file format.
・Create save files for each channel.
・RS-232C/USB/LAN supported (matching the communication function of the connected device).

Circuit Design for Impedance Measurements

The effect on the detection signal is reduced by canceling the magnetic flux of the AC measurement current and separating the source from the sense.

Issue — Effect of magnetic flux on 4-terminal measurement
(1) The magnetic flux generated by the measurement current generates induced voltage in the voltage terminal.

Measurement current
(1) Magnetic flux
(3) Magnetic flux from outside (Interference when using multiple modules simultaneously)
(3) Magnetic flux
(1) Magnetic flux
(2) Magnetic flux
Metal plate
Eddy current

(2) The magnetic flux generated by the eddy current generates induced voltage in the voltage terminal.

With the 4-terminal method, magnetic flux is generated from the AC measurement current. Further, the magnetic flux generates an eddy current in the surrounding metal, and the magnetic flux from that eddy current affects the detection signal, resulting in errors in measurement values.

Circuit Design for Problem Solving — Multiplexer module circuitry that is not easily affected by eddy currents and noise

SOURCE
SENSE

Sense and Source are separated to eliminate any effect on each other.

The Sense loop area is minimized to reduce the effect of external noise.

Magnetic flux is canceled by orienting the High/Low patterns on the Source (measurement current) side so that they oppose each other.

Choose from Two Types of Multiplexer Modules

MULTIPLEXER MODULE SW9001

This module supports 2-wire/4-wire configurations. Channel switching can be performed in 11 ms (excluding communication, command processing time, and contact bounce).

Wiring Method	No. of Channels	Signal Type	Used Signals
2-wire	22	Sense	CH 1 to CH 22
4-wire	11	Source	CH 1 to CH 11
		Sense	CH 12 to CH 22

MULTIPLEXER MODULE SW9002

This module supports 4-terminal pair configuration for use in combination with BT4560 and IM3590. 2-wire measurement is also possible (Sense only). Channel switching can be performed in 11 ms (excluding communication, command processing time, and contact bounce).

Wiring Method	No. of Channels	Signal Type	Used Signals
2-wire	6	Sense	Sense CH 1 to CH 6
4-terminal pair	6	Source	Source CH 1 to CH 6

Communication Command Transmission Function Reduces the Number of PC Ports Needed

Normally, PC control requires two ports: one communication port for switching and one for the measuring instrument.
By using the communication command transmission function on the SW1001 and SW1002, the switch mainframe can transfer control commands from the PC to the measuring instrument (and responses can be received from the device). This allows you to reduce the number of communication ports used on the measuring instrument.[*2]

*2 The measuring instrument is connected with the RS-232C. Only one instrument is supported (one port).

Scan Function

This function switches between channels in order based on the scan list registered in advance.
The switch mainframe and the EXT. I/O of the measuring instrument are connected. With the scan function, channel switching and trigger measurement can be synced for continuous scanning. [*3]

*3 To obtain the measurement value, use the data output function or the memory function on the measuring instruments.
